

AppforEventz

Project Case Study

Type	Client	Location
Hybrid App	Tvasan Technologies	Bangalore

Product Overview

A low budget event application (Hybrid) to list out details like agenda, event attendees, speakers, schedule, place details, attendees details, surveys & polls of events. This would work on multiple platforms (web, android, ios, windows, BB, Firefox OS)

Client Need

Event based app which has to work on multiple platforms.
Client had to offer to his customers at a very low cost.
SAAS model app from where the customers could create apps for themselves automatically.

appforeventz
Mobile App for Events and Conferences

Our Offering

Hybrid mobile application built using html5 css3 and angularjs

Backend would be created using .net framework and the apis for mobile app using WCF framework

Technology Used

Mobile Platforms	Backend
HTML5 Css3 Angular JS	SQL Server

Challenges Faced

→ Design

We had to make a design such that users of all platforms were comfortable with it. Also we had to create a mobile app like UI from web technologies like HTML5 and CSS3.

Animations for different transitions should also emulate the same mobile principles.

→ Offline Feature

The app had to work in offline mode also since event locations may not always have internet connection

Solution

We used the HTML5 caching technology which was considerably a new technology then with AngularJS localStorage

Impact on Client Business

A fast, responsive, cost-effective event app for mobile at a cost which can be offered at half the price other major players provide
